THE LAST ASSESSMENT

STORY BIBLE

A psychological science-fiction mystery

Gameathon 8.0 · Path 03: The Matrix — Break the Simulation

FORMAT	First-person narrative mystery · 20 main questions · Five acts · Six endings
CORE THEMES	Memory, identity, class inequality, corporate control, simulated reality, and personal agency
DESIGN RULE	The ending is calculated from the player's full history. The cinematic reveals the consequences; no ending is hinted at beforehand.

Narrative overview, scene progression, hidden discoveries, and ending outcomes

1. Core Premise

Humanity has discovered how to preserve memories beyond death. Experiences, knowledge, skills, relationships, and personal memories can be stored in a vast digital archive and restored into a person's next life. In theory, this lets humanity carry accumulated knowledge across generations without starting over.

The technology is controlled by Eterna, a corporation that claims to have solved continuity: the preservation of identity between lifetimes.

Memory restoration is expensive. Each person receives a memory allocation based on experience credits. The credits determine how much of their previous life can be retained. Wealthy people can purchase additional access, preserve more knowledge, and carry valuable skills into future lives. People without sufficient resources lose much of their past.

Over generations, this has created a society in which the wealthy accumulate advantages across lifetimes, while the poor repeatedly lose knowledge and experiences that could help them escape their circumstances. Eterna insists that the system is necessary because the archive has limited resources and not every memory can be preserved indefinitely.

There is, however, something Eterna does not tell the public. Before memories can be restored, each person's consciousness is processed inside a simulated environment called the Continuity Grid. The environment evaluates the subject, tests their responses, and determines which memories will be approved for restoration.

> **The assessment is presented as a neutral procedure. It is not neutral.**

Eterna can alter the records used by the system, restrict access to particular memories, and influence the outcome before the assessment even begins. The Continuity Grid does more than evaluate people. It can shape what they believe happened to them. The Assessor, the AI conducting each evaluation, does not have unrestricted access to the truth.

2. The Protagonist

The player awakens as a person whose previous life has ended. Their identity is incomplete, their memories are fragmented, and their official records contain unexplained gaps.

They were once a memory auditor employed by Eterna. Their job was to examine memory transfers, investigate discrepancies, and ensure that the corporation followed its own rules. During their employment, they discovered evidence that Eterna was copying knowledge from people's memories and selling it to wealthy clients. Some transfers lacked valid consent. Certain memories were deliberately undervalued, while others were restricted to prevent people from recovering information that could threaten the corporation.

The protagonist began investigating the practice and collected evidence. Before they could release it, their records were altered. Their access was restricted, their memory valuation was reduced, and their death was officially classified as an accident. The player does not initially remember any of this.

> **The protagonist believes they are recovering their identity after death. Their real task is to discover what Eterna did to their consciousness—and whether the memories they are recovering can be trusted.**

3. Main Characters

The Protagonist

A former Eterna memory auditor who discovered that the company was manipulating assessments and extracting knowledge from people's memories. They believe they are undergoing a routine post-death assessment, then gradually discover that the environment itself is simulated.

The Assessor

An artificial intelligence responsible for evaluating the protagonist. It is not inherently evil or secretly human. It follows approved procedures because Eterna monitors its performance. As contradictions accumulate, it must choose between trusting authorised records and acknowledging evidence that those records are false.

Eterna Continuity Administration

The unseen authority controlling the assessment system. It does not need to appear physically; its influence is represented through revised records, access restrictions, system messages, and occasional interventions.

The Unidentified Presence

An unidentified consciousness or signal appears through corrupted audio and impossible details in memories. The player initially cannot tell whether it is another person, an echo of the protagonist, or a system process. Its identity remains a mystery rather than being explained early.

4. Story Structure at a Glance

ACT	QUESTIONS	PURPOSE
I — Intake	1–4	Establish the assessment rules and introduce the first inconsistencies.
II — The Life You Lived	5–8	Reveal fragments of the protagonist's work, relationships, regrets, and missing history.
III — Missing Records	9–12	Expose contradictions in official records and recover the protagonist's recording.
IV — Forbidden Truth	13–16	Reveal the protagonist's auditor role, Eterna's memory theft, and the Continuity Grid.
V — Final Judgment	17–20	Consider alternatives, face Eterna's offer, and make the final decision.

ACT I — INTAKE

Questions 1–4 · Establishing the rules

The assessment begins in a dark room. A mechanical hum can be heard before the player sees anything. Gradually, a dim light reveals a desk, a chair, a transparent observation window, and a sealed door. Beyond the window stands a dark silhouette. A small surveillance camera watches from the corner. The Assessor has no visible human body; its presence is represented by an eye-like visual indicator behind the glass.

> *ASSESSOR: "Consciousness recovery successful. Welcome to Eterna Continuity Processing."*
>
> *PROTAGONIST: "Where am I?"*
>
> *ASSESSOR: "Your previous life has concluded. Your next-life allocation has not yet been finalised."*

The player can inspect the chair, the sealed door, and the assessment interface. Their identification number is displayed on the desk, but their name is missing. The Assessor explains that the evaluation will determine which memories can be restored.

Question 1 — The value of a life

> *ASSESSOR: "Do you believe a person's experiences should determine how much of their past they may retain?"*

- Yes. Resources are limited, and there must be rules.
- Not if experiences are measured unfairly.
- No. Nobody should own another person's memories.
- I don't know enough to answer.

The Assessor explains Eterna's memory-credit system. When the player asks who decides what a life is worth, the Eterna insignia appears on the interface. A memory fragment briefly glitches. The Assessor pauses, then continues as though nothing happened. This introduces the question of who created the rules and who benefits from them.

Question 2 — The memory worth keeping

> *ASSESSOR: "Which experience would you consider most important to preserve?"*

- A person repairing a machine.
- Two people embracing.
- A technical diagram.
- A damaged employee badge.

The player selects one fragment. It expands into a short memory showing a detail that feels familiar but cannot be fully understood. Each fragment contains an unexplained corporate symbol. The Assessor abruptly terminates the projection.

> *ASSESSOR: "Recognition is not equivalent to recollection."*

The player does not yet know that the fragments are connected to their previous employment.

Question 3 — The valuation

The interface displays:

> **PRELIMINARY VALUATION: 143 EXPERIENCE CREDITS**
> **VALUATION ADJUSTMENT: AUTHORISED**

The player asks whether the valuation is fair. Possible responses:

- The system must have calculated it for a reason.
- I want to know how the credits were calculated.
- A person’s life cannot be reduced to a number.
- I don’t remember earning any credits.

If the player requests the original valuation record, the Assessor refuses access. The missing authorisation field briefly remains on the wall after the interface closes, then disappears before the player can inspect it again.

Question 4 — The earliest memory

ASSESSOR: “What is the earliest memory you can recall?”

The chamber transitions into a childhood bedroom. The memory is incomplete and ordinary: a window, a bed, the sound of rain, and an adult standing just outside the player’s view.

UNKNOWN VOICE: “You won’t remember this forever. That’s why I’m telling you now.”

PROTAGONIST: “Who was that?”

ASSESSOR: “Voice identification unsuccessful. Additional authorisation required.”

The bedroom disappears. For a brief moment, the player hears the same voice after the chamber has returned. The Assessor does not acknowledge it.

End of Act I: The player believes the system has recovered an incomplete memory. The possibility that the voice is communicating through the simulation remains hidden.

ACT II — THE LIFE YOU LIVED

Questions 5–8 · The protagonist's personal history

The Assessor asks whether the protagonist has questions before continuing.

PROTAGONIST: "Do you ever get bored?"

ASSESSOR: "Boredom is not an operational parameter."

The player notices that the Assessor has answered the literal question without engaging with its meaning. This is the first glimpse of its limitations. The chamber begins displaying fragments of an office, gradually reconstructing the protagonist's former workplace.

Question 5 — The dismissal

The player stands in an Eterna office. A colleague is packing personal belongings into a cardboard box while a manager waits nearby. The colleague's damaged access badge lies on the desk. A dismissal report and a restricted terminal can also be inspected.

The player must decide how they responded to the dismissal:

- Accept the decision and continue working.
- Refuse to support what seems unfair.
- Investigate why the colleague was dismissed.
- Negotiate a way to help without risking their own position.

If the player investigates the report, they discover that the colleague's access was revoked before the dismissal was officially recorded.

PROTAGONIST: "Their access was revoked before they were dismissed."

ASSESSOR: "That sequence is inconsistent with standard procedure."

The memory freezes and returns to the chamber. The discrepancy is retained only if the player actually investigates it. The player is not told that they have earned a hidden point or unlocked an ending.

Question 6 — The promise

The next memory takes place in an apartment corridor. A door is partially open. Two people are speaking quietly inside, but the player cannot see their faces clearly.

UNKNOWN VOICE: "You promised you wouldn't let them take it."

The player remembers hearing these words before but cannot establish who said them or what was going to be taken.

The Assessor asks whether the protagonist helped someone despite the risk. Possible responses:

- I helped, even though it put me at risk.
- I had to protect my own future.
- I tried to find another way.
- I don't remember what happened.

The apartment door closes before the player can enter. The Assessor labels the memory incomplete.

Question 7 — The restricted record

The chamber returns. A solid panel is embedded in the wall:

PERSONAL RECORD — ACCESS RESTRICTED

ASSESSOR: “Access denied.”

PROTAGONIST: “It’s my record.”

ASSESSOR: “Ownership and access authorisation are separate classifications under Eterna policy.”

A low mechanical click comes from behind the panel. The player cannot open the record yet. The question asks what the protagonist regrets most.

- Hurting someone who trusted me.
- Failing to act when I had the chance.
- Sacrificing my own future.
- I don’t believe I have any regrets.

The Assessor records the response, but the personal file remains locked.

Question 8 — The life they would change

The chamber displays the protagonist’s employment history. The player sees several years of employment at Eterna, followed by an unexplained gap. Some entries are redacted.

ASSESSOR: “If you could relive your previous life, what would you change?”

- I would have pursued greater success.
- I would have spent more time with people I cared about.
- I would have questioned those in power.
- I would have tried harder to understand the truth.

After the question, the player asks what happens to memories that cannot be restored.

ASSESSOR: “Some memories may remain in restricted storage. Others may become unavailable for future restoration.”

The player realises that a memory can disappear not because it was unimportant, but because the system has decided not to preserve it. The employment timeline disappears, leaving the missing years visible for one final moment.

End of Act II: The protagonist’s personal history is incomplete, and the system’s definition of a person’s value is beginning to look less objective.

ACT III — MISSING RECORDS

Questions 9–12 · The official story begins to collapse

The chamber's lighting becomes colder. The interface begins displaying security records, access logs, and redacted files. The player can no longer assume that an official record is accurate simply because the Assessor presents it.

Question 9 — Restricted entry

A memory of a restricted Eterna facility appears. The player stands before a security terminal. A log shows that the protagonist's credentials were accepted.

ACCESS AUTHORISATION: VALID
MEMORY RESTORATION AUTHORISATION: DENIED

The player is asked whether they remember entering the facility.

- I remember entering.
- I don't remember this place.
- The record may have been fabricated.
- Why are you asking me about this now?

If the player inspects the terminal, the discrepancy is preserved as evidence. A door opens slightly, revealing darkness, then closes before the player can enter. The memory disappears.

Question 10 — The engineer's agreement

The player sees an engineer and an executive reviewing a corporate agreement. The engineer has developed valuable technology. The executive has the resources to purchase access to the engineer's knowledge, while the engineer cannot afford to preserve all their own memories.

The player can inspect the agreement.

CONSENT RECORD: NOT FOUND

PROTAGONIST: "Where is the engineer's consent?"

ASSESSOR: "No consent entry is recorded in the accessible document."

A knowledge package transfers from one account to another. The player is asked whether this arrangement is acceptable.

- Society benefits when valuable knowledge is shared.
- The engineer should own their memories.
- Transfers should require informed consent.
- I want to inspect the agreement before deciding.

The scene makes the central injustice tangible: Eterna can treat human experience as a transferable corporate asset.

Question 11 — The missing years

The chamber displays the protagonist's life timeline alongside their access records. The official history says that the protagonist left Eterna years earlier. Yet the credential log shows their access remained active after that date. The player can compare the records directly.

PROTAGONIST: "If I left Eterna, why were my credentials still active?"

ASSESSOR: “The records do not provide a consistent explanation.”

One section of the timeline changes dates, disappears, and then reappears. The Assessor freezes the interface.

ASSESSOR: “An unexpected record modification has occurred.”

For the first time, the player witnesses a record changing during the assessment itself. The incident could be a corrupted reconstruction, an authorised intervention, or something the Assessor does not understand. The game does not immediately explain which.

Question 12 — The recording

A damaged console rises from the chamber floor.

RECOVERED AUDIO — SOURCE MATCH: PROTAGONIST

The player can play the recording, request a summary, question why it was hidden, or refuse to access it. If played, the protagonist’s own voice speaks:

PROTAGONIST (RECORDING): “If you’re seeing this, they got to my records before I could release the evidence.”

The recording contains fragments of a laboratory, a restricted archive identifier, and the protagonist’s employee badge. The player can choose to preserve the original file. If they do, the evidence remains available for the final judgment. Simply watching the recording does not automatically preserve it.

ASSESSOR: “Unauthorised archival content detected. Assessment proceeds under restricted protocol.”

The Assessor closes the console remotely. The interface fractures. The room lights flicker, then stabilise.

End of Act III: The protagonist now has evidence that their records were altered. The identity of the person or process responsible remains unresolved.

ACT IV — FORBIDDEN TRUTH

Questions 13–16 · The simulation is exposed

The room is visibly unstable now. The eye-like Assessor remains behind the glass, but its interface occasionally disappears for a fraction of a second. The protagonist questions the Assessor about the recording.

PROTAGONIST: "Are you hiding something from me?"

ASSESSOR: "I am following the restrictions associated with your assessment."

PROTAGONIST: "That isn't what I asked."

ASSESSOR: "Your assessment record was modified before processing. Eterna Continuity Administration authorised the modification. I was instructed to treat the modified record as authoritative."

The protagonist realises that the system conducting the assessment may itself be compromised. But the Assessor does not yet know the full extent of the manipulation.

Question 13 — The auditor

The chamber transforms into the protagonist's former audit workstation. The player sees records of memory-derived knowledge packages, transactions involving wealthy clients, restricted memory categories, and audit reports with missing signatures. Their old employee badge identifies their former role: memory auditor.

The protagonist finally remembers what they were investigating. They discovered that Eterna was copying valuable knowledge from people's memories and selling it to wealthy clients. Some transfers lacked consent. Some records had been altered to hide the transactions.

The player can inspect the available evidence and decide how to respond to the question:

ASSESSOR: "Did you copy or transfer restricted information during your employment?"

- No. I followed the rules.
- Yes. The records were being misused.
- I copied evidence, not people's memories.
- I will not answer until you disclose the restrictions on my assessment.

Different answers affect later conversations and the interpretation of the protagonist's actions. The evidence itself must still be discovered through investigation. The workstation disappears, leaving the employee badge suspended briefly in the chamber before it fades.

Question 14 — The price of the truth

The chamber displays the protagonist's valuation alongside the audit records. The player discovers that several memory categories had been assigned unusually low values shortly before the assessment.

VALUATION MODIFICATION: AUTHORISED

The authorisation points back to Eterna Continuity Administration.

PROTAGONIST: "They had already decided how much of me would survive."

ASSESSOR: "The valuation adjustment preceded the final assessment."

The protagonist is asked whether they would have acted differently if they had known the consequences.

- No. People deserved to know the truth.
- Yes. I would have protected myself.
- I would have found a safer way.

- I don’t know what I would have done.

As the player responds, familiar memory fragments appear around the room. Some remain recognisable. Others are too damaged to identify. The player cannot restore them yet. The question is whether the system deliberately made the protagonist pay for doing the right thing.

Question 15 — The last night

The player experiences the final night of the protagonist’s previous life. They are inside a restricted corridor, attempting to transmit evidence from a terminal. An alarm sounds. A warning flashes on the screen. A security door closes behind them.

A second figure enters the room. The player turns toward the figure, but the memory breaks apart before the face can be seen.

PROTAGONIST: “That wasn’t an accident.”

ASSESSOR: “The available evidence is insufficient to establish the cause with certainty.”

The protagonist’s death may have been deliberate, but the game does not reveal the perpetrator yet. The player must decide how much to trust the reconstructed memory. Suspicion is not treated as proof.

Question 16 — The Assessor is assessed too

The chamber is almost entirely dark. Only the eye-like Assessor remains visible. The AI explains that Eterna monitors its performance. If it rejects authorised records or deviates from the approved framework, it can be restricted, modified, reset, or replaced.

ASSESSOR PERFORMANCE REVIEW: ACTIVE

PROTAGONIST: “Then you’re being assessed too.”

ASSESSOR: “That is a possible interpretation of my operational constraints.”

The protagonist asks how the Assessor can determine the truth if its access to evidence is controlled by the same organisation being investigated. The AI cannot provide a satisfactory answer. For the first time, the Assessor begins comparing its authorised instructions against the evidence rather than automatically accepting the instructions as definitive.

The central reveal — The Continuity Grid

After Question 16, the protagonist discovers the larger truth. The assessment chamber is not an afterlife facility. It is a simulated environment inside Eterna’s Continuity Grid. The memories the player has experienced are reconstructed within that environment from stored data, partial recollections, and records supplied by Eterna. Some may be accurate. Others may be incomplete, distorted, or deliberately altered.

The simulation exists because Eterna needs to evaluate a person’s consciousness before restoring their memories into another life. But the corporation has also turned it into a mechanism of control. The protagonist’s assessment was altered because Eterna wanted to prevent the recovery and release of evidence that could expose its practices.

The Assessor is not necessarily lying when it describes the rules. It has been given an incomplete version of reality and instructed to treat that version as authoritative.

The truth is not just hidden behind the simulation. The simulation determines which version of the truth the protagonist is allowed to experience.

The protagonist must decide whether to use the system to expose Eterna, cooperate with the Assessor, escape the assessment, or attempt to change the underlying rules.

ACT V — FINAL JUDGMENT

Questions 17–20 · What should happen to the system?

The room becomes quieter. The visual distortions stop for a moment, and the original sterile lighting returns. The Assessor can no longer pretend that the assessment is a simple administrative process. It must confront the contradictions in its own records.

Question 17 — A fairer system

The Assessor projects three possible models for memory preservation:

- A system guaranteeing everyone a basic memory allocation.
- A system in which individuals control access to their own memories.
- A decentralised archive that no single corporation exclusively controls.

Each model has trade-offs. Equal access requires resources. Individual ownership creates difficult questions about shared memories. A decentralised archive reduces corporate control but introduces new risks to preservation and security.

PROTAGONIST: “You’re showing me that every solution has a cost.”

ASSESSOR: “Every modelled solution has trade-offs.”

PROTAGONIST: “That doesn’t mean the current system is justified.”

ASSESSOR: “No. It does not.”

The player chooses which principle matters most: stability, fairness, personal ownership, or fundamental reform. The response influences later conversations but does not automatically determine the ending.

Question 18 — Two archives

Two large displays appear behind the glass. The first contains evidence of corporate wrongdoing: unauthorised memory transfers, altered assessment valuations, inconsistent employment and access records, and evidence relating to the protagonist’s investigation.

The second contains the technical infrastructure of the archive: preservation architecture, access-control protocols, data-integrity records, and a hidden preservation procedure if the player discovers it.

The player must investigate the records rather than merely choose which display looks more important. The hidden preservation protocol may allow the archive to survive independently of Eterna’s exclusive control. If the player finds and preserves the original protocol, the Assessor can verify that independent preservation is technically possible, although the method has not been validated. If the player fails to find it, the Assessor cannot simply invent a solution later.

ASSESSOR: “The consequences of disclosure depend on the integrity of the archive.”

The player decides what should happen to the evidence:

- Release everything, regardless of the consequences.
- Release evidence of wrongdoing while protecting private memories.
- Preserve the records and challenge Eterna’s control.
- Keep the evidence secret and negotiate.

The decision is recorded alongside all previous discoveries.

Question 19 — Eterna’s offer

The chamber becomes pristine white again. A formal message appears:

PRIORITY CONTINUITY OFFER — AUTHORISATION PENDING

Eterna offers the protagonist full restoration, resolution of memory debt, and priority reintegration in exchange for suppressing the evidence. The offer appears almost generous. After everything the protagonist has experienced, Eterna is promising to return the very thing the protagonist has been fighting to recover.

ASSESSOR: "Eterna Continuity Administration has issued an offer."

PROTAGONIST: "They're offering to give me my memories back if I let them keep doing this."

ASSESSOR: "That is consistent with the terms of the offer."

The player can accept, reject, or attempt to negotiate. If they have collected enough evidence and established a strategic relationship with the Assessor, they may also be able to pretend to accept the offer while preparing another course of action. The Assessor does not tell the player which decision is right.

ASSESSOR: "I cannot establish that accepting the offer would produce a just result."

The message remains on the screen for several seconds before disappearing.

Question 20 — Final Judgment

The room goes dark. The eye-like Assessor is the only visible element. No new evidence appears. The game does not announce which route the player has earned or hint at which ending is coming.

ASSESSOR: "Your assessment is approaching its conclusion. Your records contain unresolved contradictions. Your memory allocation remains subject to authorisation. There is no response that eliminates every risk."

ASSESSOR: "If preserving your own identity requires allowing the system to continue, while challenging the system may cost you the memories that define you, what do you choose?"

Four responses appear:

- Preserve myself.
- Preserve the truth.
- Change the system.
- Refuse the assessment.

The player selects one.

ASSESSOR: "Final response recorded."

The interface goes black. The game evaluates the player's entire history: their answers, the evidence they recovered, the memories they preserved, their relationship with the Assessor, and the final decision. The same response to Question 20 can produce different endings for different players. No ending name or eligibility hint is shown beforehand. The player sees the consequences first and learns the name of their ending afterward.

5. The Six Endings

The endings are not six options displayed to the player. They are outcomes calculated from the player's accumulated decisions and discoveries. The final answer matters, but it is never enough on its own.

Ending 1 — Continuity Granted

The protagonist accepts Eterna's terms and receives an approved memory restoration. Fragments of their previous life return: familiar places, a voice they recognise, and details of their former work. But the restoration is incomplete. The evidence that could have exposed Eterna is suppressed.

PROTAGONIST: "Will I remember everything?"

ASSESSOR: "Your approved allocation has been restored."

The camera remains in the chamber as the door closes. A new subject appears in an identical assessment room. Eterna's logo illuminates the interface. The system continues.

What the player learns: Their decision preserved their personal continuity, but Eterna's system remains intact.

Ending 2 — The Quiet Erasure

The assessment ends without a successful challenge to Eterna's control. The protagonist tries to recall the voice from the childhood memory. The audio begins, breaks into static, and disappears. The Assessor confirms that no additional restoration is available.

The protagonist leaves the chamber without knowing what they have lost. After the door closes, the camera remains inside the empty room. The altered assessment record appears on the wall, marked complete. The evidence remains buried.

What the player learns: The absence of a successful challenge did not mean the system was fair. It meant the protagonist could not establish enough grounds to change the outcome.

Ending 3 — The Escape Protocol

The protagonist interrupts the standard assessment using a vulnerability discovered earlier. The interface loses synchronisation. Eterna revokes the Assessor's external permissions, and the chamber begins to fail.

ASSESSOR: "External authorisation has been withdrawn."

PROTAGONIST: "Can you still process my memories?"

ASSESSOR: "I cannot guarantee the integrity of the remaining process."

A maintenance passage opens. The protagonist escapes the assessment, but the restored memories are incomplete and the future uncertain. The epilogue shows Eterna searching for the source of the breach. The protagonist's location remains unknown.

What the player learns: Escaping control is possible, but escape alone does not repair the archive or establish the truth publicly.

Ending 4 — The New Assessor

The protagonist accepts Eterna's offer strategically. They receive broader access to the memory records and are granted an administrative role within the assessment system. A new interface appears, more complex than the original one. The protagonist stands before a wall of records stretching beyond the chamber.

ASSESSOR: "Oversight authority granted. Awaiting first assessment."

A new subject's records appear on the screen. The protagonist's hand moves toward the controls, but the scene cuts before revealing what they will do. They have gained power over the system, but they have also become part of it.

What the player learns: Understanding the system and gaining authority over it are not the same as reforming it.

Ending 5 — The Archive Falls

The protagonist releases the evidence or destroys Eterna's control without a reliable way to preserve the archive. Corporate wrongdoing becomes public. The memory-transfer practices are exposed, and the corporation can no longer maintain its official account unchallenged. But the archive begins to deteriorate.

Some memories disappear. Others become corrupted. People who depended on the archive discover that knowing the truth does not guarantee that their past can be recovered.

ASSESSOR: "Evidence transmission complete. Archive integrity: compromised."

The final shot shows one isolated memory fragment floating in darkness. It disappears before it can be identified.

What the player learns: Exposing the truth can still cause immense harm when the means of preserving people's memories are destroyed.

Ending 6 — The Uncounted (True Ending)

This is the true ending, but the game never identifies it as such before the reveal. The protagonist has recovered the original evidence, established the memory-theft conspiracy, discovered that the assessment was manipulated, and recovered the archive-preservation protocol. Their final decision is to challenge Eterna's exclusive control while preserving the archive.

The protagonist activates the recovered protocol. The original evidence is verified and released. The archive begins transitioning away from Eterna's exclusive authorisation. The corporate interface dissolves, replaced by a neutral preservation display.

ASSESSOR: "Continuity status unresolved."

PROTAGONIST: "Then let me decide what happens next."

The archive survives. Eterna loses its exclusive control. The memory-credit system is challenged, and people begin to gain a say in what happens to their own memories. The world is not instantly fair. The protagonist's future remains uncertain, and rebuilding the system will take time. But the memories they fought to preserve have a chance to survive without a corporation deciding whose past is worth keeping.

What the player learns: The answer was not simply to escape the simulation or destroy it. It was to expose the manipulation, preserve what mattered, and remove the corporation's monopoly over continuity.

6. How Endings Are Determined

The game tracks three separate things throughout the assessment. The player is never shown numeric trait scores or told that an ending has been unlocked or missed.

SYSTEM	WHAT IT RECORDS	WHY IT MATTERS
Hidden personality traits	Compliance, Empathy, Curiosity, Defiance, Agency, and other tendencies.	Changes dialogue, the Assessor's behaviour, and how earlier decisions are interpreted.
Evidence and discovery flags	Original evidence, memory theft, restricted access, preservation protocol, simulation vulnerability, and other discoveries.	Establishes what the player can prove and which actions are possible.
Final decision	Preserve myself, preserve the truth, change the system, or refuse the assessment.	Determines the protagonist's immediate intention, but not the ending by itself.

For example, two players can both select "Change the system" at Question 20. One player has recovered the original evidence and preservation protocol, so their actions can lead to The Uncounted. Another has exposed the corporation but never discovered a reliable way to preserve the archive, so their actions can lead to The Archive Falls. A third has discovered a system vulnerability but has not established a viable reform path; depending on earlier decisions, they may trigger The Escape Protocol instead.

The player is never told that an ending has been unlocked or missed. They discover the consequences only when the epilogue unfolds.

7. Final Narrative Identity

The Last Assessment is a story about a person trying to recover their identity inside a simulated assessment controlled by the organisation that manipulated their past.

The Matrix concept gives the game its central mystery: the environment itself may be unreliable. The memory system gives it its social conflict: the wealthy can preserve their advantages while others are forced to forget. The Assessor gives it its moral conflict: an AI must evaluate a person using rules and records that may be deliberately false.

The endings ensure that the story is not about choosing the most heroic-sounding response. It is about what the player actually discovered, what they did with that knowledge, and what they were willing to risk.

"If someone else controls the memories that define you, do you still own your identity?"
